Creating Survival Plots

Informative and Elegant with survminer

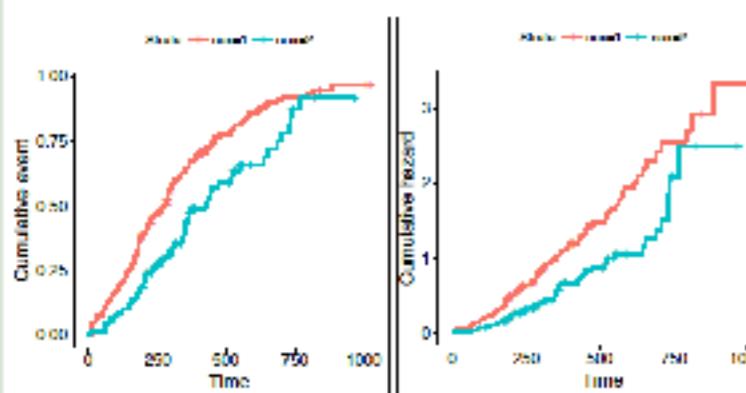

Survival Curves

The `ggsurvplot()` function creates ggplot2 plots from `survfit` objects.

Use the `fun` argument to set the transformation of the survival curve. E.g. "event" for cumulative events, "cumhaz" for the cumulative hazard function or "pct" for survival probability in percentage.

```
ggsurvplot(fit, data = Lung, fun = "event")
ggsurvplot(fit, data = Lung, fun = "cumhaz")
```

With lots of graphical parameters you have full control over look and feel of the survival plots; position and content of the legend; additional annotations like p-value, title, subtitle.

```
ggsurvplot(fit, data = Lung,
conf.int = TRUE,
pval = TRUE,
fun = "pct",
risk.table = TRUE,
size = 1,
linetype = "strata",
palette = c("#F781BF",
            "#2E9FDF"),
legend = "bottom",
legend.title = "Sex",
legend.labs = c("Male",
              "Female"))
```

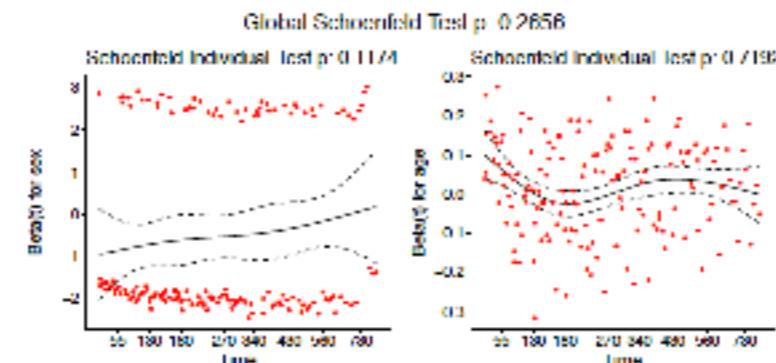

Diagnostics of Cox Model

The function `cox.zph()` from `survival` package may be used to test the proportional hazards assumption for a Cox regression model fit. The graphical verification of this assumption may be performed with the function `ggcoxzph()` from the `survminer` package. For each covariate it produces plots with scaled Schoenfeld residuals against the time.

```
library("survival")
fit <- coxph(Surv(time, status) ~ sex + age, data = Lung)
ftest <- cox.zph(fit)
ftest
```

	rho	chisq	p
sex	0.1236	7.457	0.117
age	0.0775	0.129	0.719
GLOBAL	NA	2.651	0.266

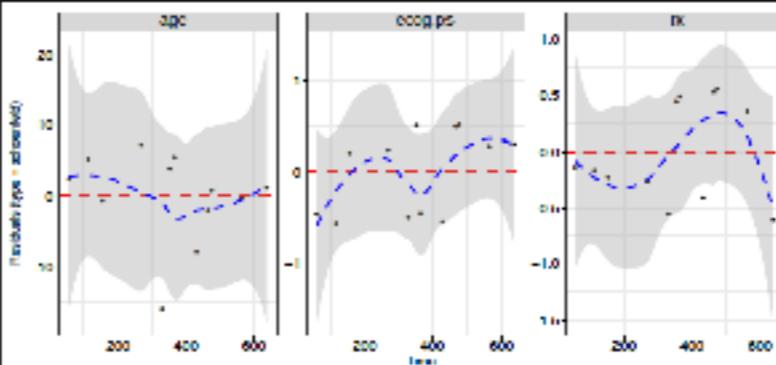

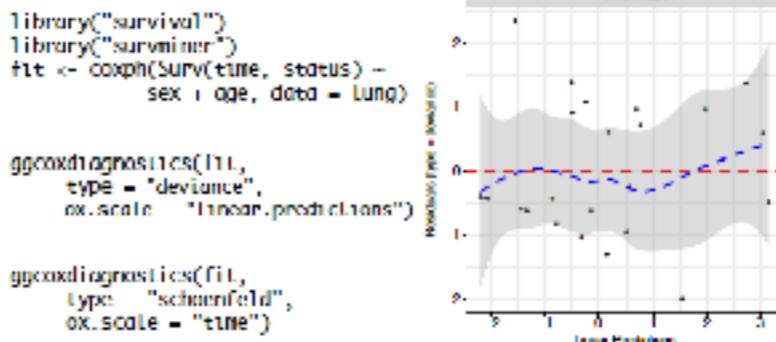

```
library("survminer")
ggcoxzph(ftest)
```

The function `ggcoxdiagnostics()` plots different types of residuals as a function of time, linear predictor or observation id. The type of residual is selected with `type` argument. Possible values are "martingale", "deviance", "score", "schoenfeld", "dlbeta", "dlnbeta", and "scaledsch".

The `ox.scale` argument defines what shall be plotted on the OX axis. Possible values are "linear.predictions", "observation.id", "time".

Logical arguments `hline` and `sline` may be used to add horizontal line or smooth line to the plot.

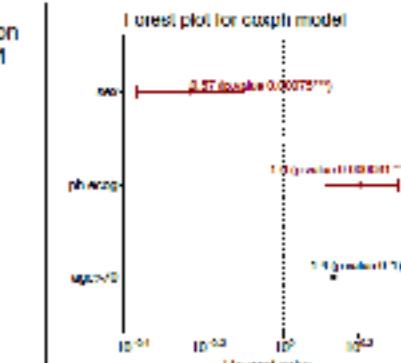

Summary of Cox Model

The function `ggforest()` from the `survminer` package creates a forest plot for a Cox regression model fit. Hazard ratio estimates along with confidence intervals and p values are plotted for each variable.

```
library("survival")
library("survminer")
Lung$age <- ifelse(Lung$age > /0, ">/0", "<= /0")
fit <- coxph(Surv(time, status) ~ sex + ph.ecog + age, data = Lung)
fit
```

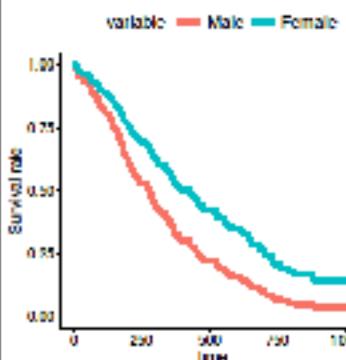

```
## Call:
## coxph(formula = Surv(time, status) ~ sex + ph.ecog + age, data=Lung)
##
##          coef exp(coef) se(coef)    z      p
## sex     -0.567    0.567   0.168 -3.37 0.00075
## ph.ecog  0.470    1.600   0.113  4.16 3.1e-05
## age>/0  0.387    1.359   0.187  1.61 0.10175
##
## Likelihood ratio test=31.6 on
## n = 227, number of events= 164
ggforest(fit)
```

The function `ggcoxadjustedcurves()` from the `survminer` package plots Adjusted Survival Curves for Cox Proportional Hazards Model. Adjusted Survival Curves show how a selected factor influences survival estimated from a Cox model.

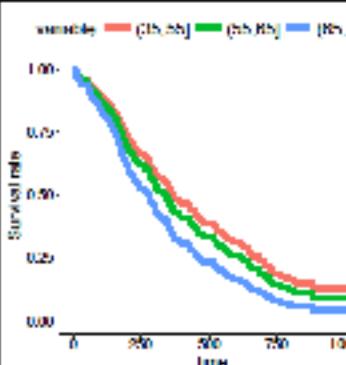

Note that these curves differ from Kaplan Meier estimates since they present expected survival based on given Cox model.

```
library("survival")
library("survminer")
Lung$sex <- ifelse(Lung$sex == 1,
                    "Male", "Female")
fit <- coxph(Surv(time, status) ~ sex + ph.ecog + age,
             data = Lung)
ggcoxadjustedcurves(fit, data = Lung,
                     variable = Lung$sex)
```

Note that it is not necessary to include the grouping factor in the Cox model. Survival curves are estimated from Cox model for each group defined by the factor independently.

```
Lung$age3 <- cut(Lung$age,
                   c(35, 55, 65, 85))
ggcoxadjustedcurves(fit, data = Lung,
                     variable = Lung$age3)
```

BILLCD8 - A Multivariable Survival Model as a Simple and Clinically Useful Prognostic Tool to Identify High-risk Cutaneous Melanoma Patients. Donizy P, Biecek P, Halon A, Matkowski R. **Anticancer Res.** 2016 Sep; 36(9):4739-47.

Czy możemy wykorzystać „małe modele” na dużych komputerach?

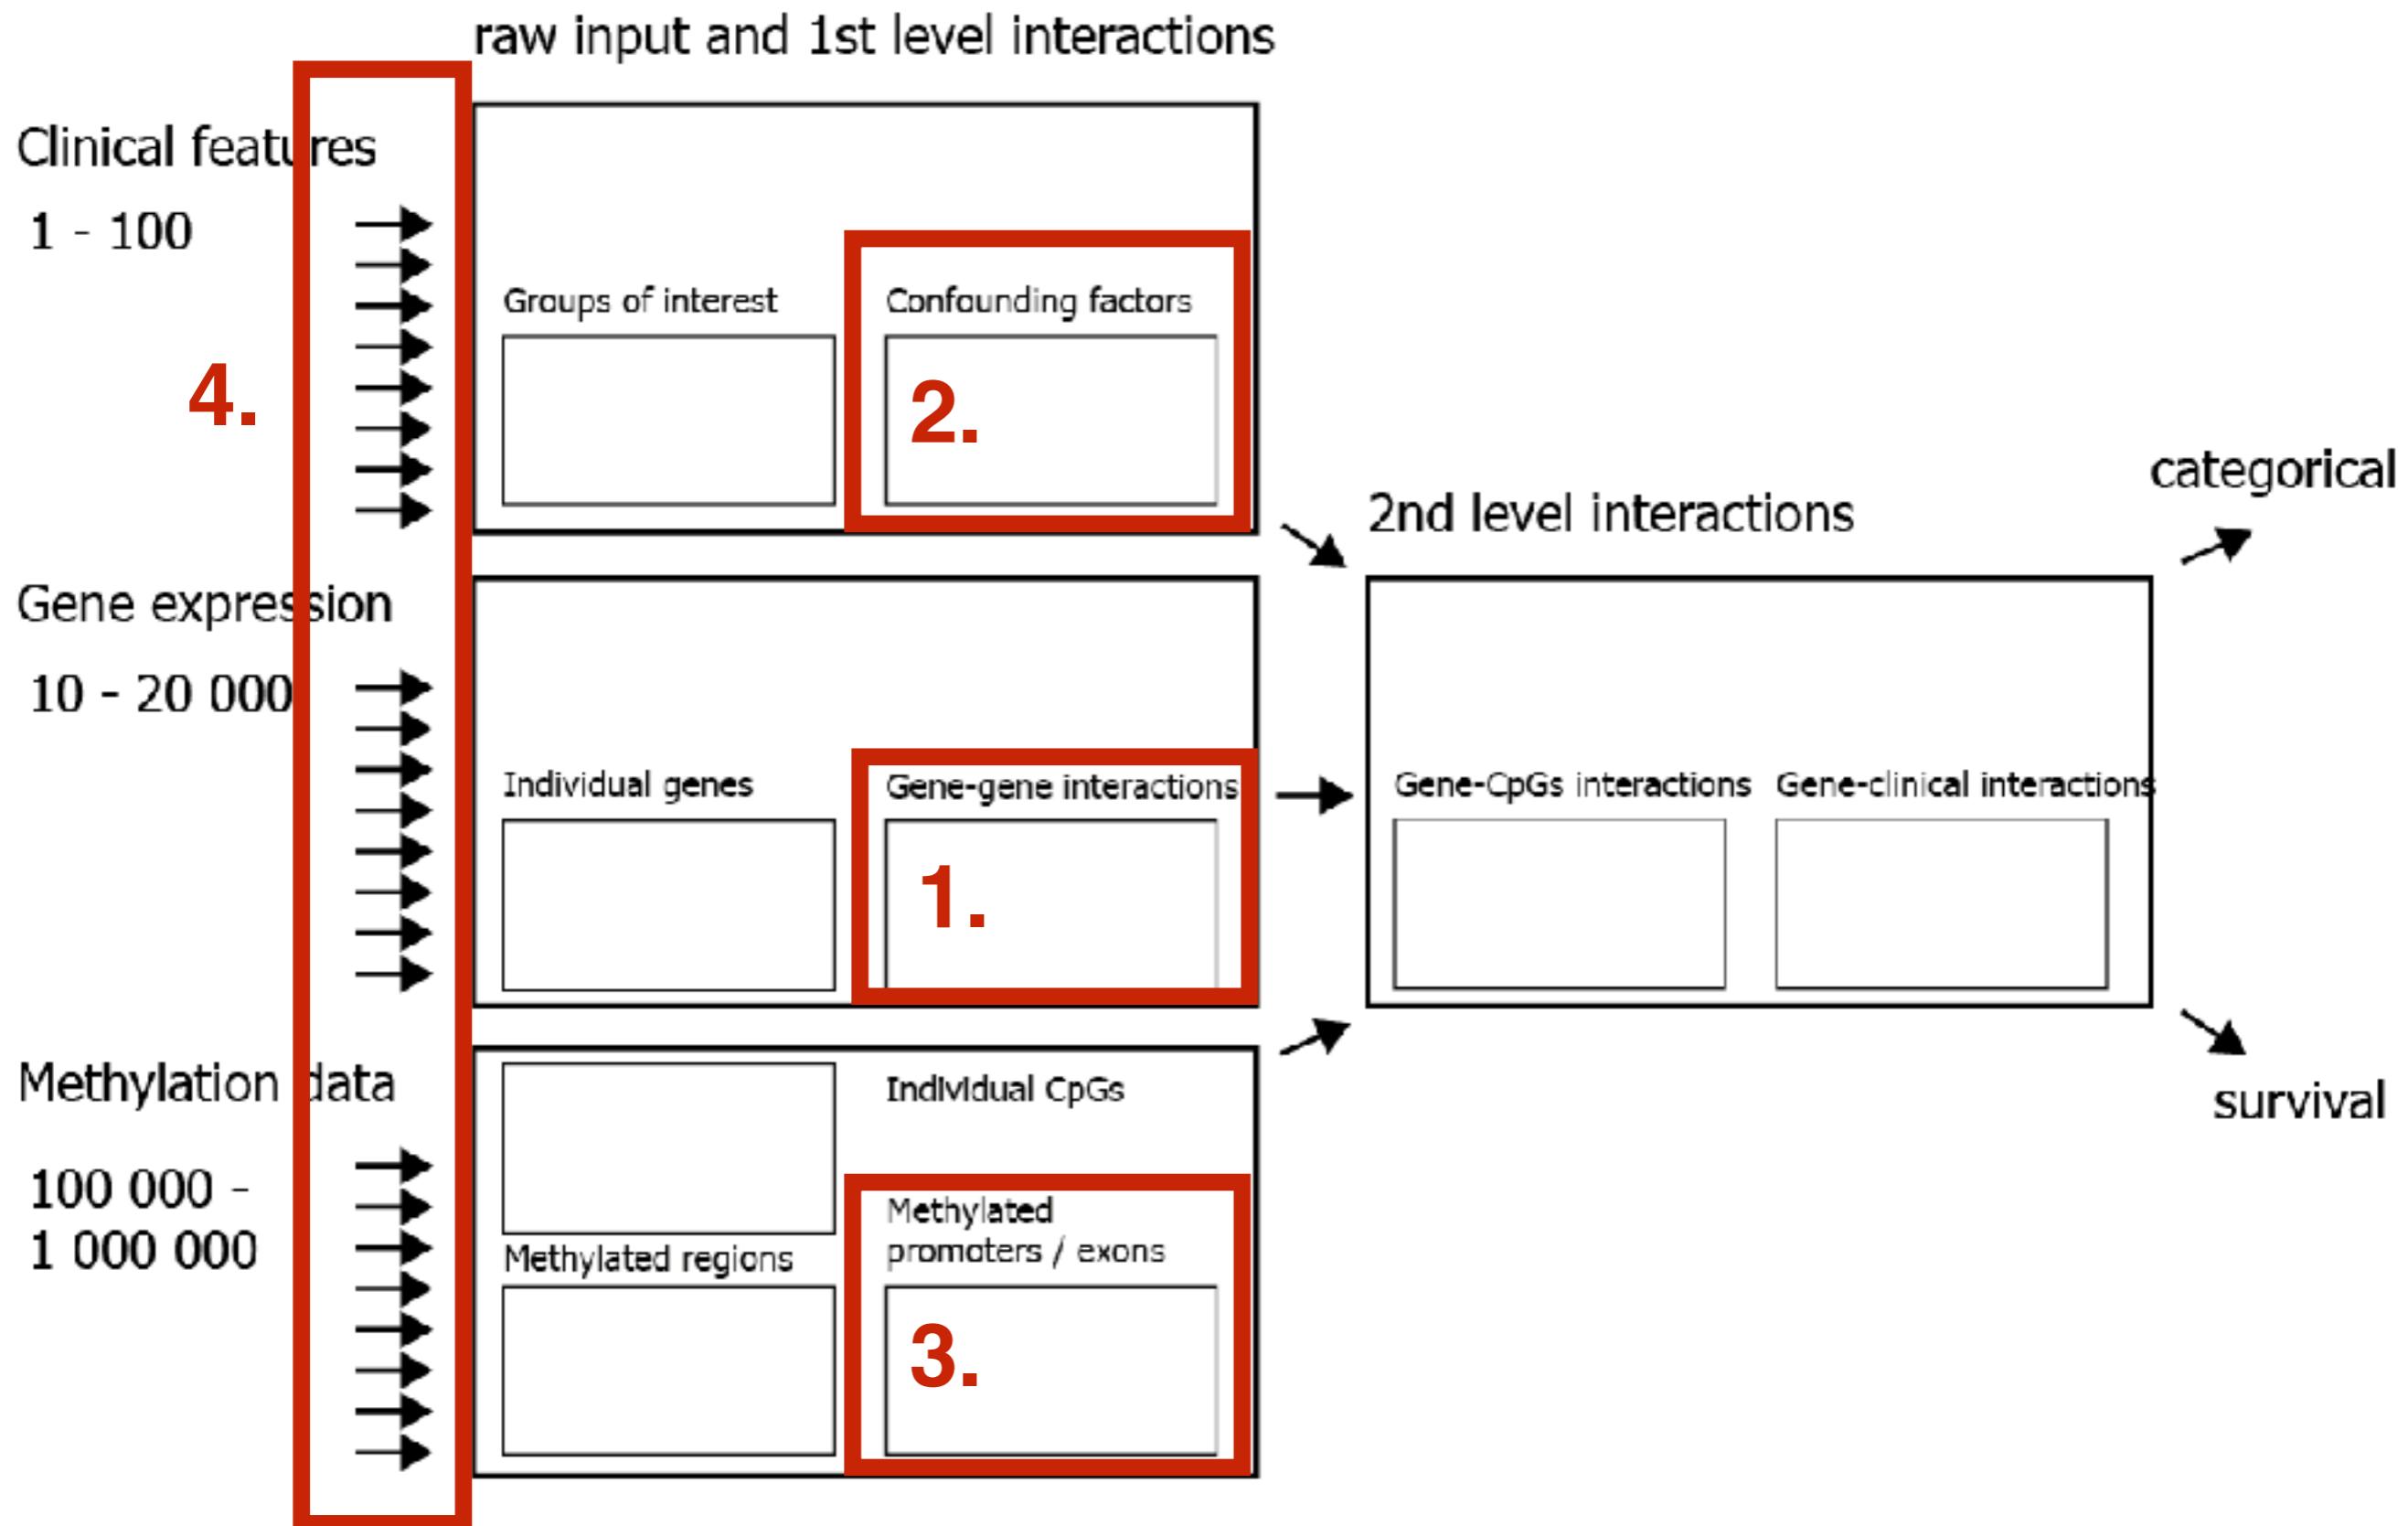

Nie! - *the curse of big data.*

- Modele typu drew decyzyjne nie wykorzystują dużej liczby cech. Aby z tym sobie poradzić można stosować bagging, boosting lub inne komitety klasyfikatorów.
- Modele regresyjne mają dużą wariancję. Potrzebujemy bardziej stabilnych ocen parametrów, takich jak LASSO, regresja grzbietowa lub „sieci elastyczne”.
- Różne źródła danych różnią się bardzo ze względu na liczbę zmiennych - brak prostego rozwiązania.
- Etykiety klas są silnie niezbalansowane - brak prostego rozwiązania, undersampling / oversampling czasem pomaga.
- ...

Learning with Structure: MLGenSig (Machine Learning Genetic Signatures)

Learning with Structure: MLGenSig (Machine Learning Genetic Signatures)

Problem 1

Gene2Vec = word2vec for genes

- 20 000 genów -> 200 000 000 par genów (interakcje)
- Nie możemy testować 200 milionów hipotez !!!
- Jako wybrać kandydatury do testowania interakcji?

Problem 1

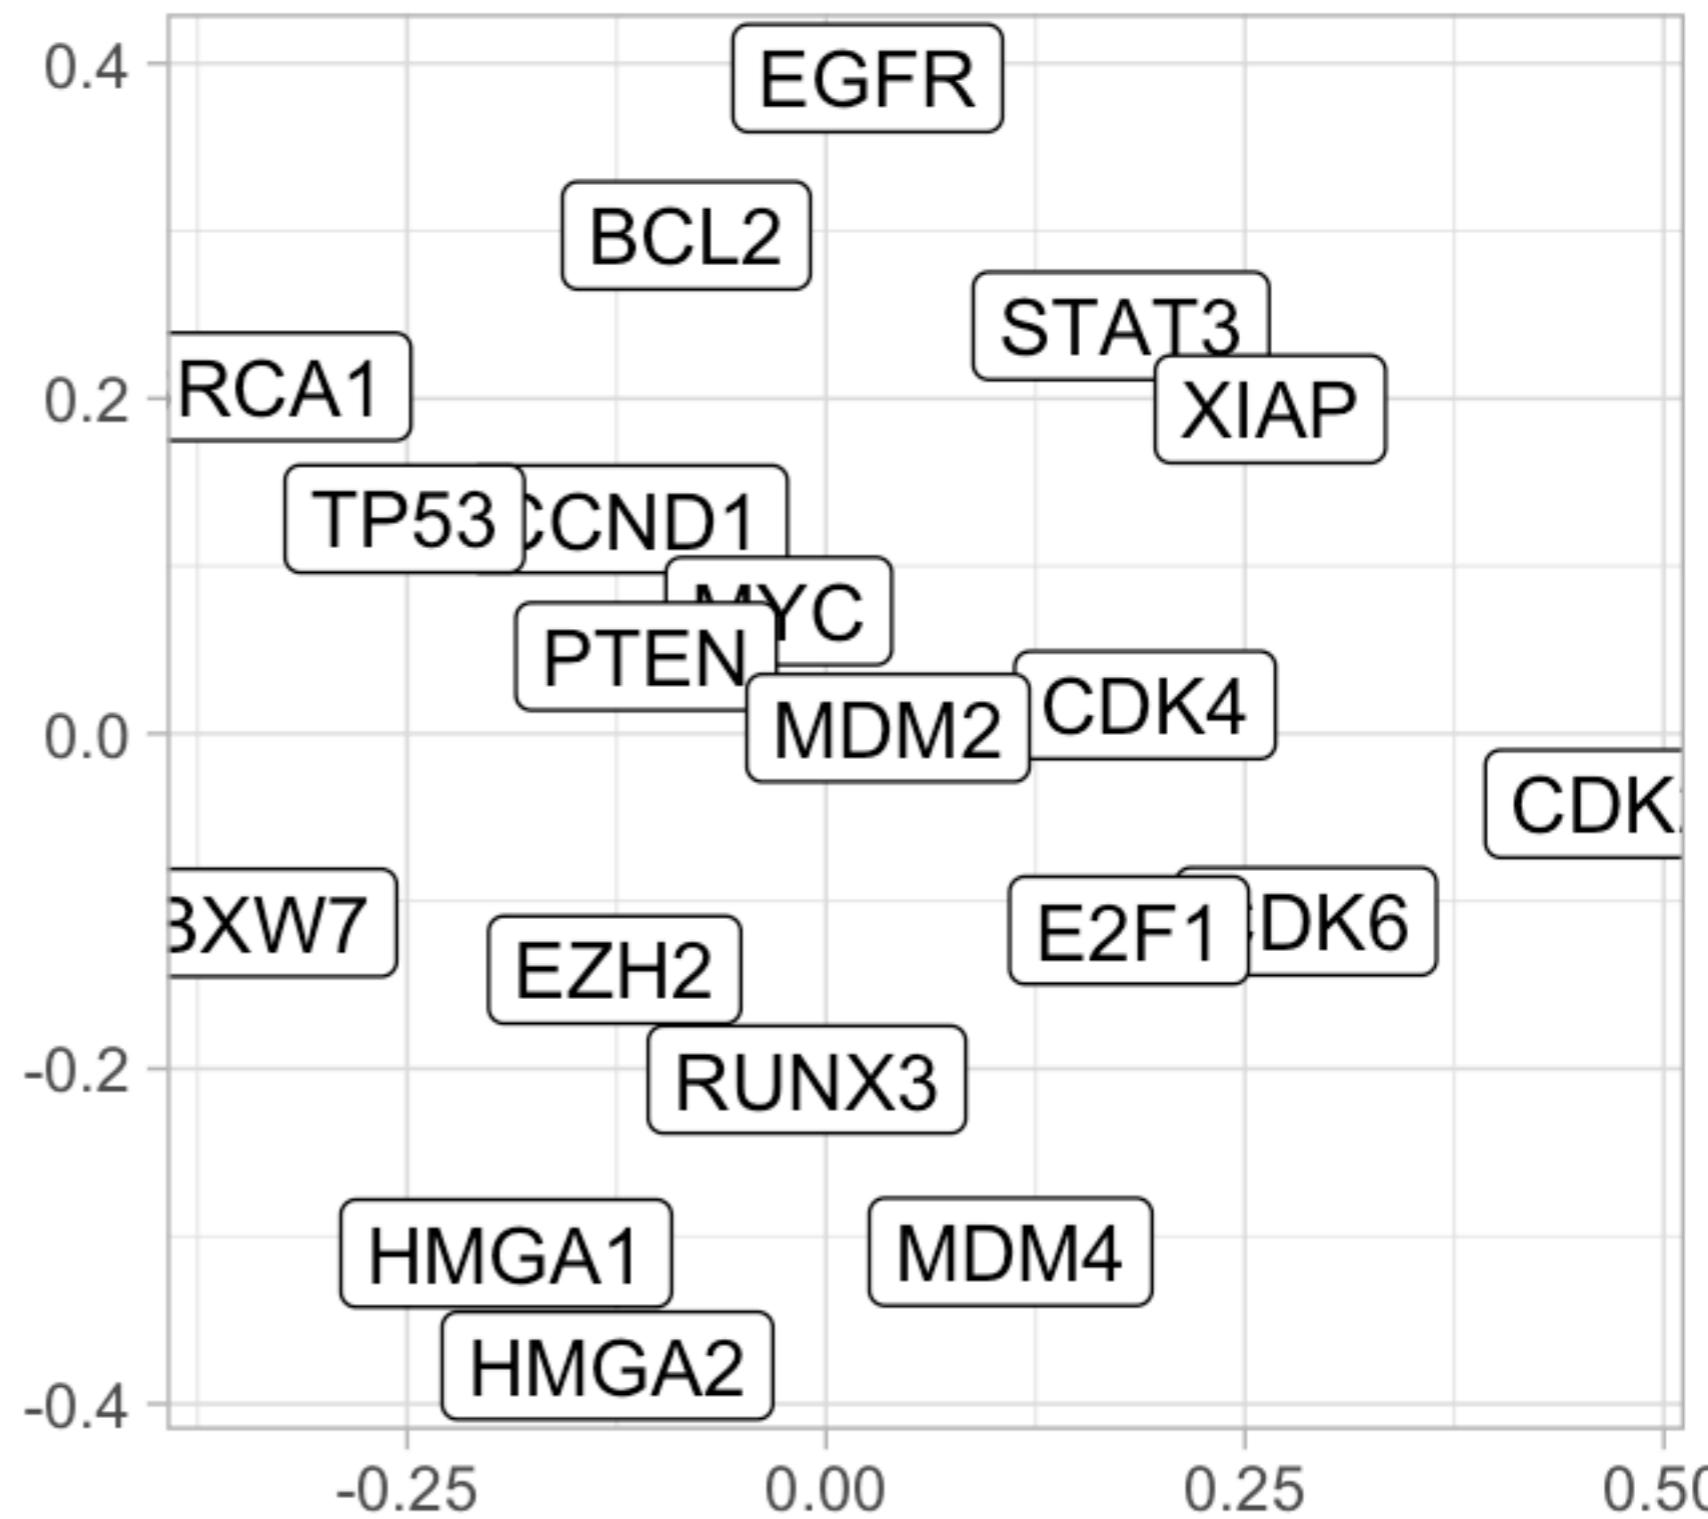

Gene2Vec = word2vec for genes

- 20 000 genów -> 200 000 000 par genów (interakcje)
- Nie możemy testować 200 milionów hipotez !!!
- Jako wybrać kandydatury do testowania interakcji?
- Algorytm Word2vec produkuje d-wymiarowe reprezentacje słów ($d \sim 100$).
- *Words that occur in similar contexts tend to have similar meanings (Harris, 1954; Firth, 1957; Deerwester et al., 1990). – If words have similar row vectors in a word–context matrix, then they tend to have similar meanings.*

You shall know a word by the company it keeps

Problem 1

1. Pobierz streszczenia z bazy PUBMED [~25GB skompresowanych danych]
2. Wyznacz kontekst występowania słów i termów
3. Użyj GloVe lub innego algorytmu word2vec aby znaleźć 50-, 200, 600-wymiarową reprezentację słów
4. Znajdź geny bliskie sob - kandydatury do badań interakcji

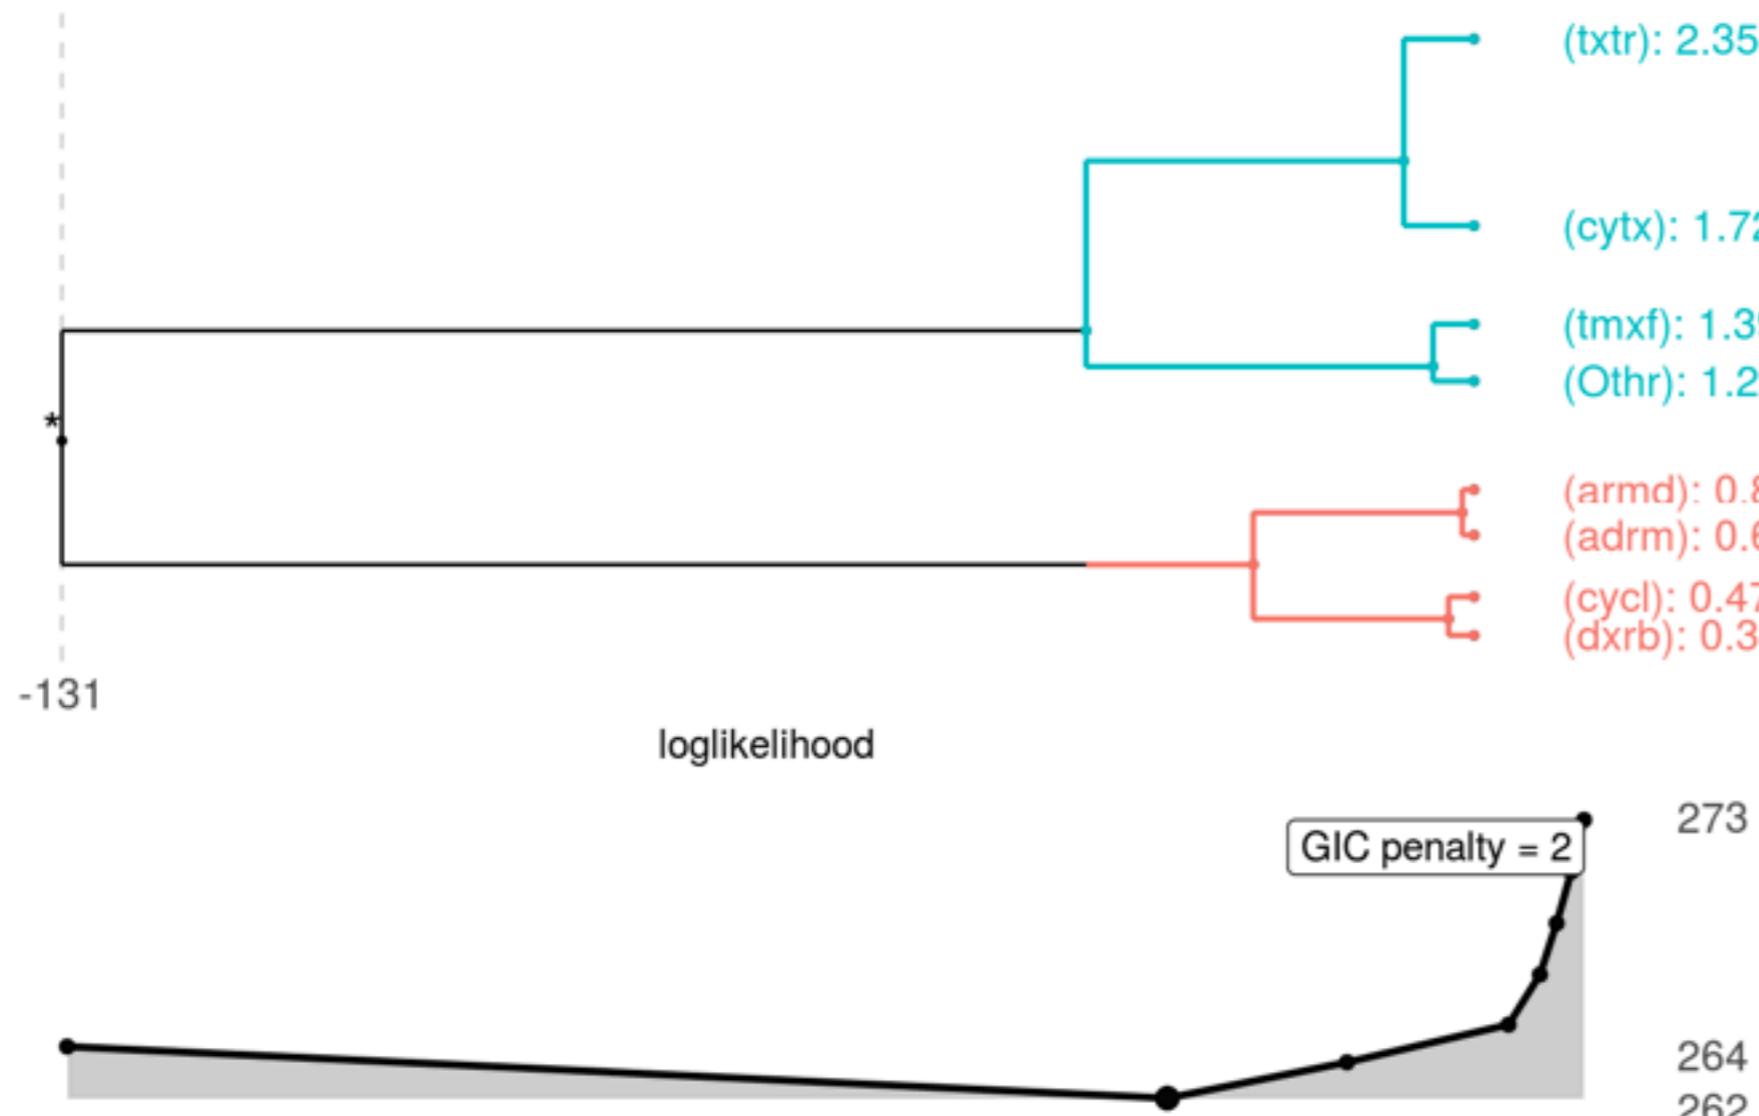

Problem 2

Factor Merger Tree

Survival plot

Problem 2

factorMerger:
an extended hierarchical post-hoc testing

Project Lead:
Agnieszka Sitko

FactorMerger - set of tools to support results from post hoc testing

Level fusing plot

The top-left plot shows level fusing paths (merging paths). With arguments **family=**, **show=**, **fuse=**, **spacing=**, one can select how to merge factors and what shall be presented on OX/OY axes.

Argument	Summary
panel = "all"	All panels
panel = "left"	Only left two panels
panel = "top"	Only top two panels
panel = "merging"	Merging path plot

Argument Summary

Argument	Summary
show = "likelihood"	Plot likelihood on OX axis
show = "p-value"	Plot p-values or OX axis
fuse = "all2all"	Compare all pairs of groups
fuse = "nearby"	Compare nearby groups
fuse = "cluster"	DMR4glm algorithm
spacing = "equidistant"	Levels equidistant on OY scale
spacing = "effects"	Levels according to their effects
family = "gaussian"	For one-dimensional Gaussian
family = "mgaussian"	For multi dimensional Gaussian
family = "binomial"	For binomial regression
family = "survival"	For Cox regression

Group summaries

The top-right panel shows group characteristics. Use the parameter **summary=** to select the most suitable presentation.

Argument	Summary
summary = "heatmap"	For mgaussian
summary = "profile"	For mgaussian
summary = "boxplot"	For gaussian
summary = "means"	For gaussian
summary = "survival"	For Cox regression
summary = "proportions"	For binomial regression

Merging path plot

Group success proportion

box plot means

Problem 3

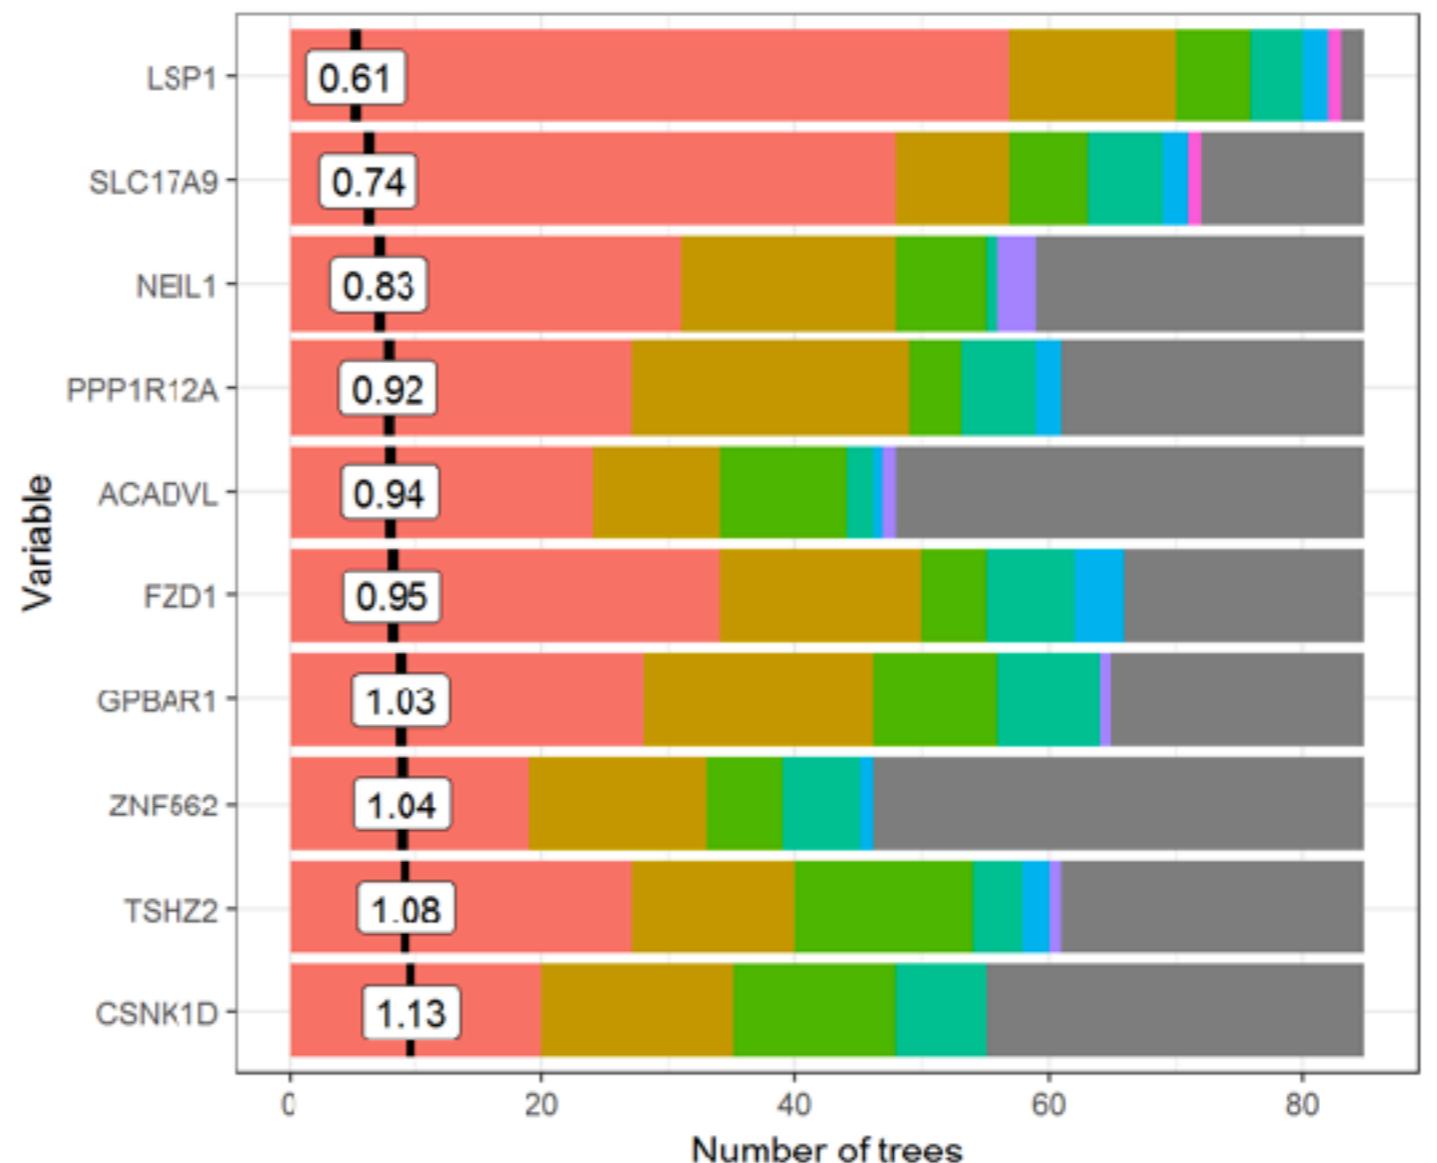

randomForestExplainer:
What is in the (random) forest?

Project Lead:
Ola Paluszynska

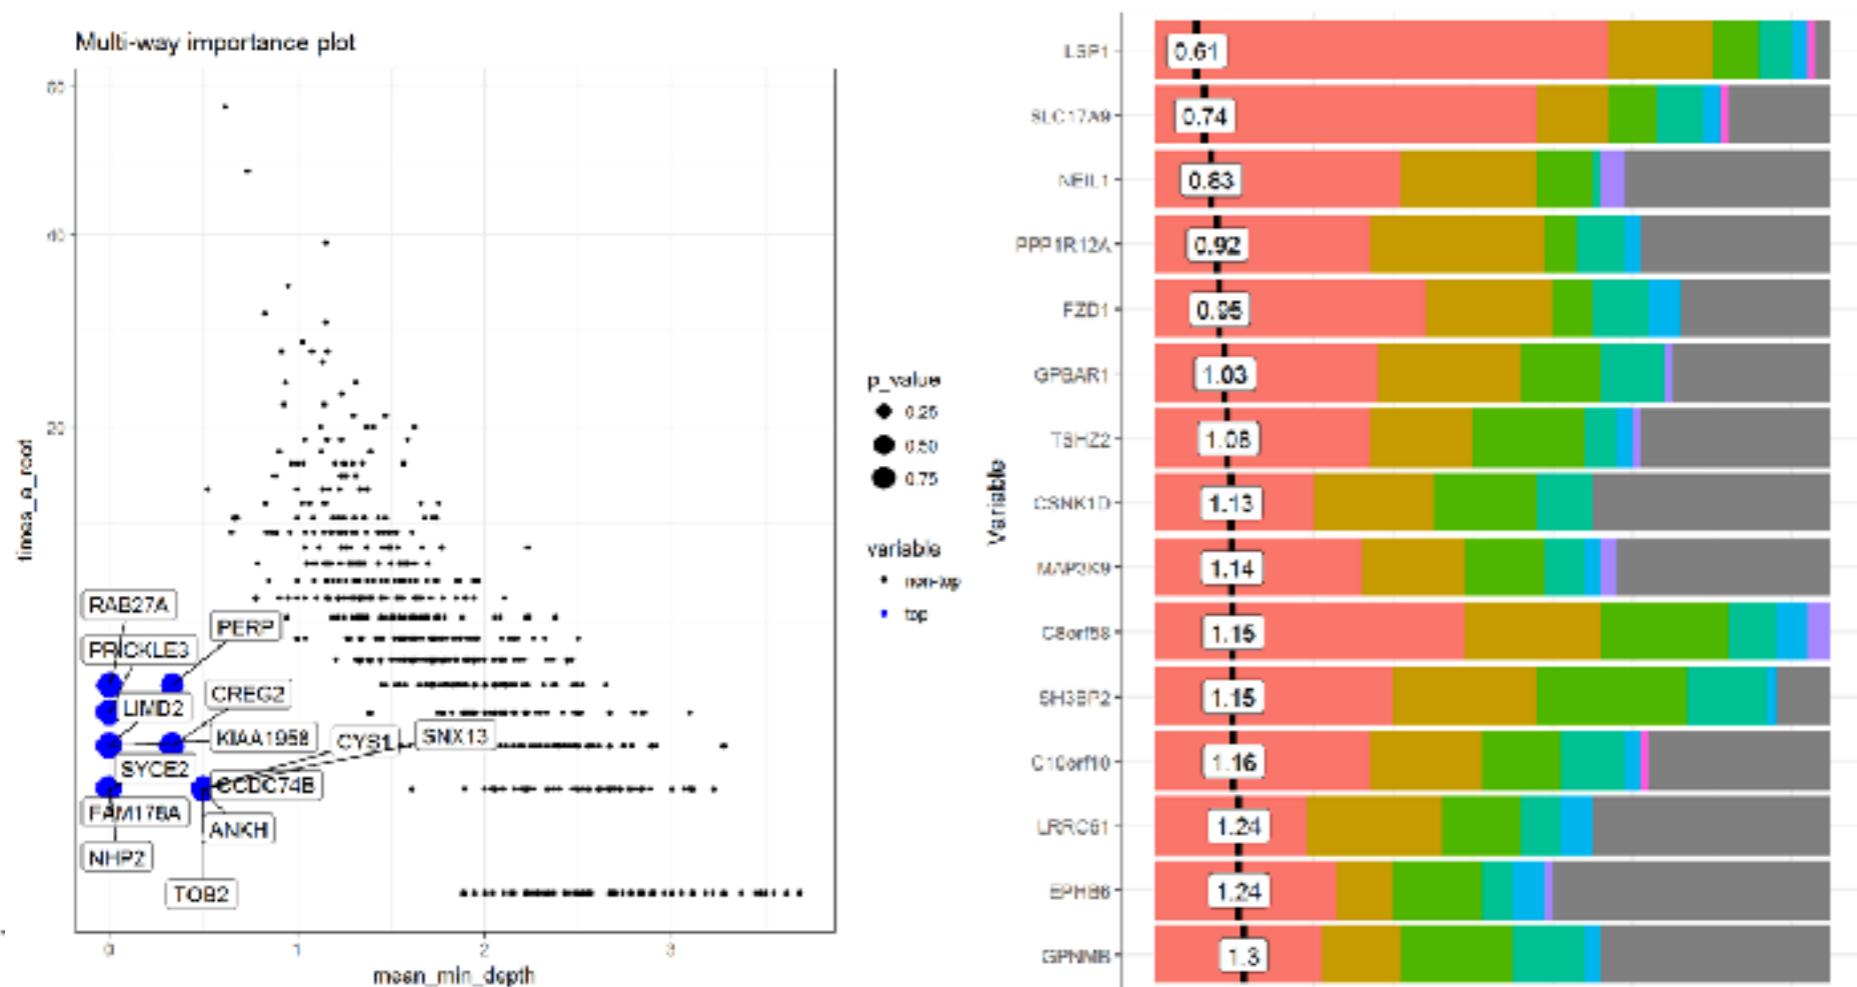

Multi-way importance plot

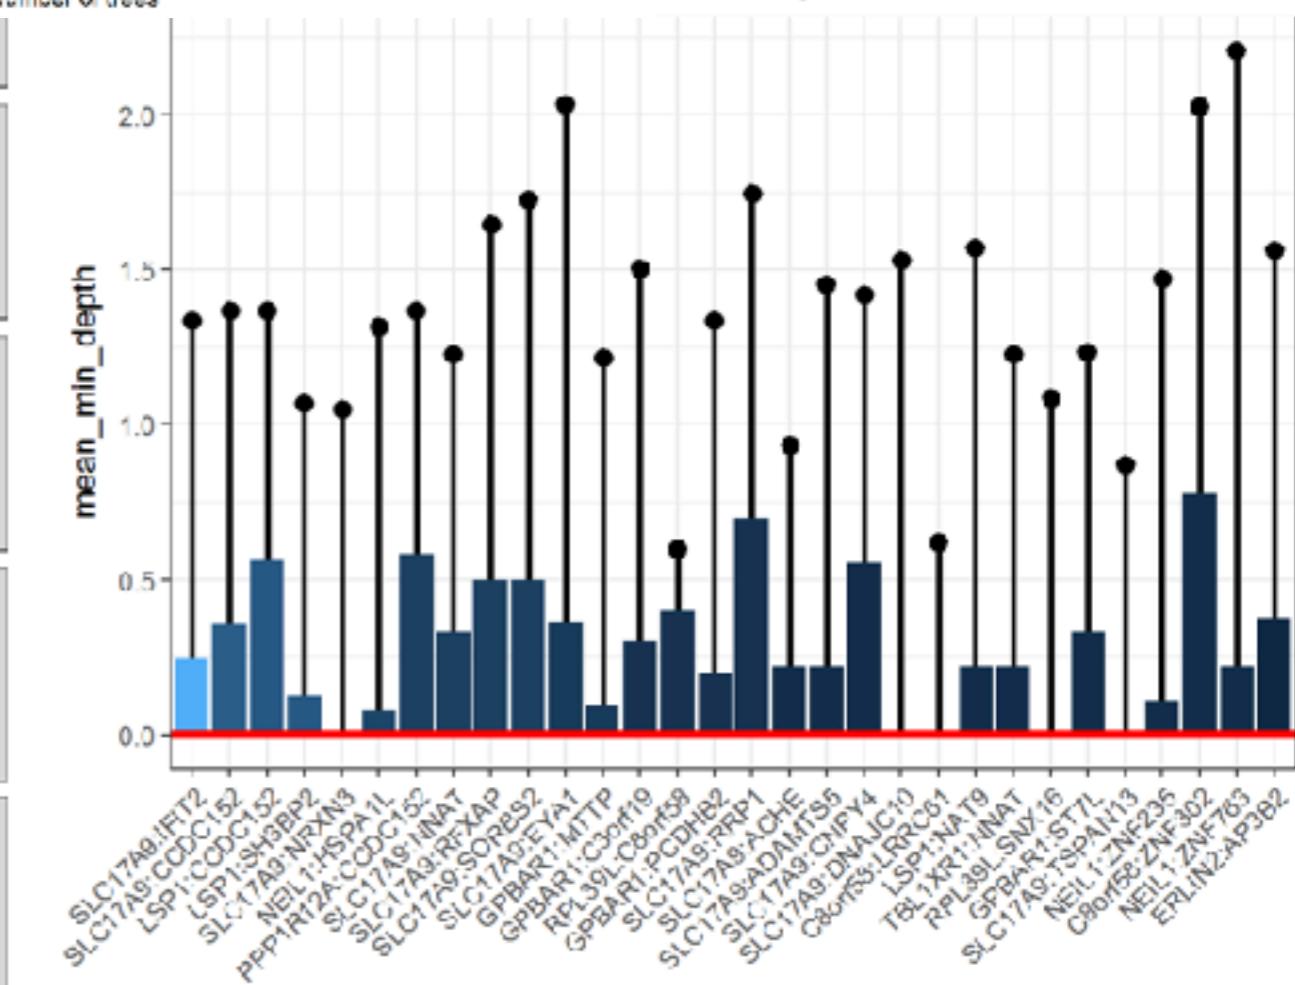

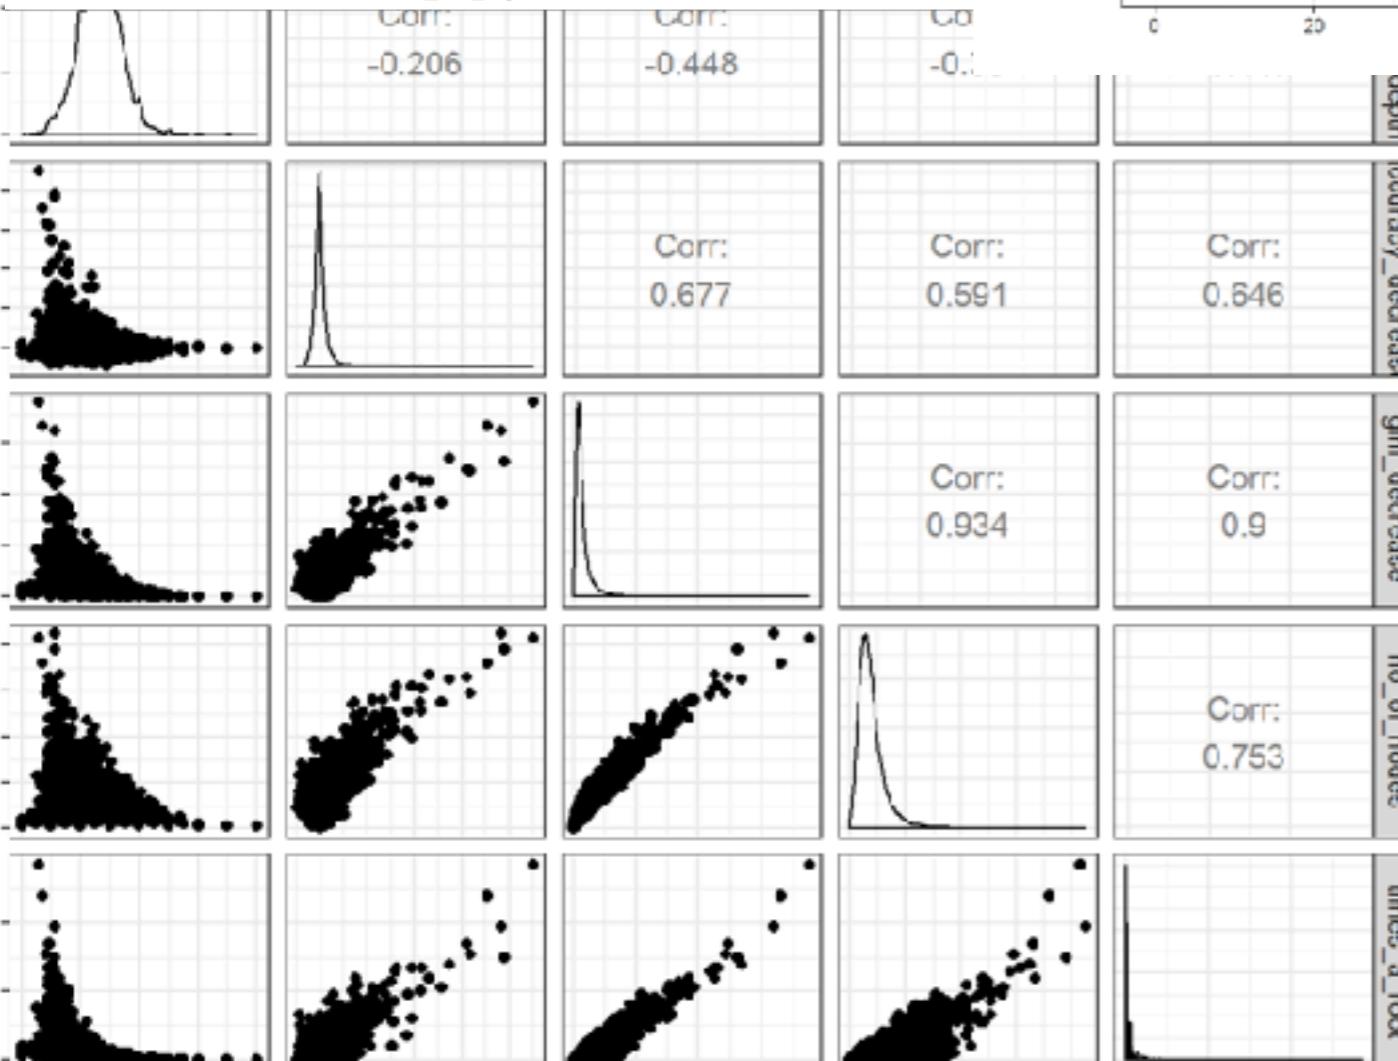

The distribution of minimal depth

Project Lead:
Ola Paluszynska

most frequent interactions

Problem 4

Ważność cech

z Random Forest

Cechy kliniczne

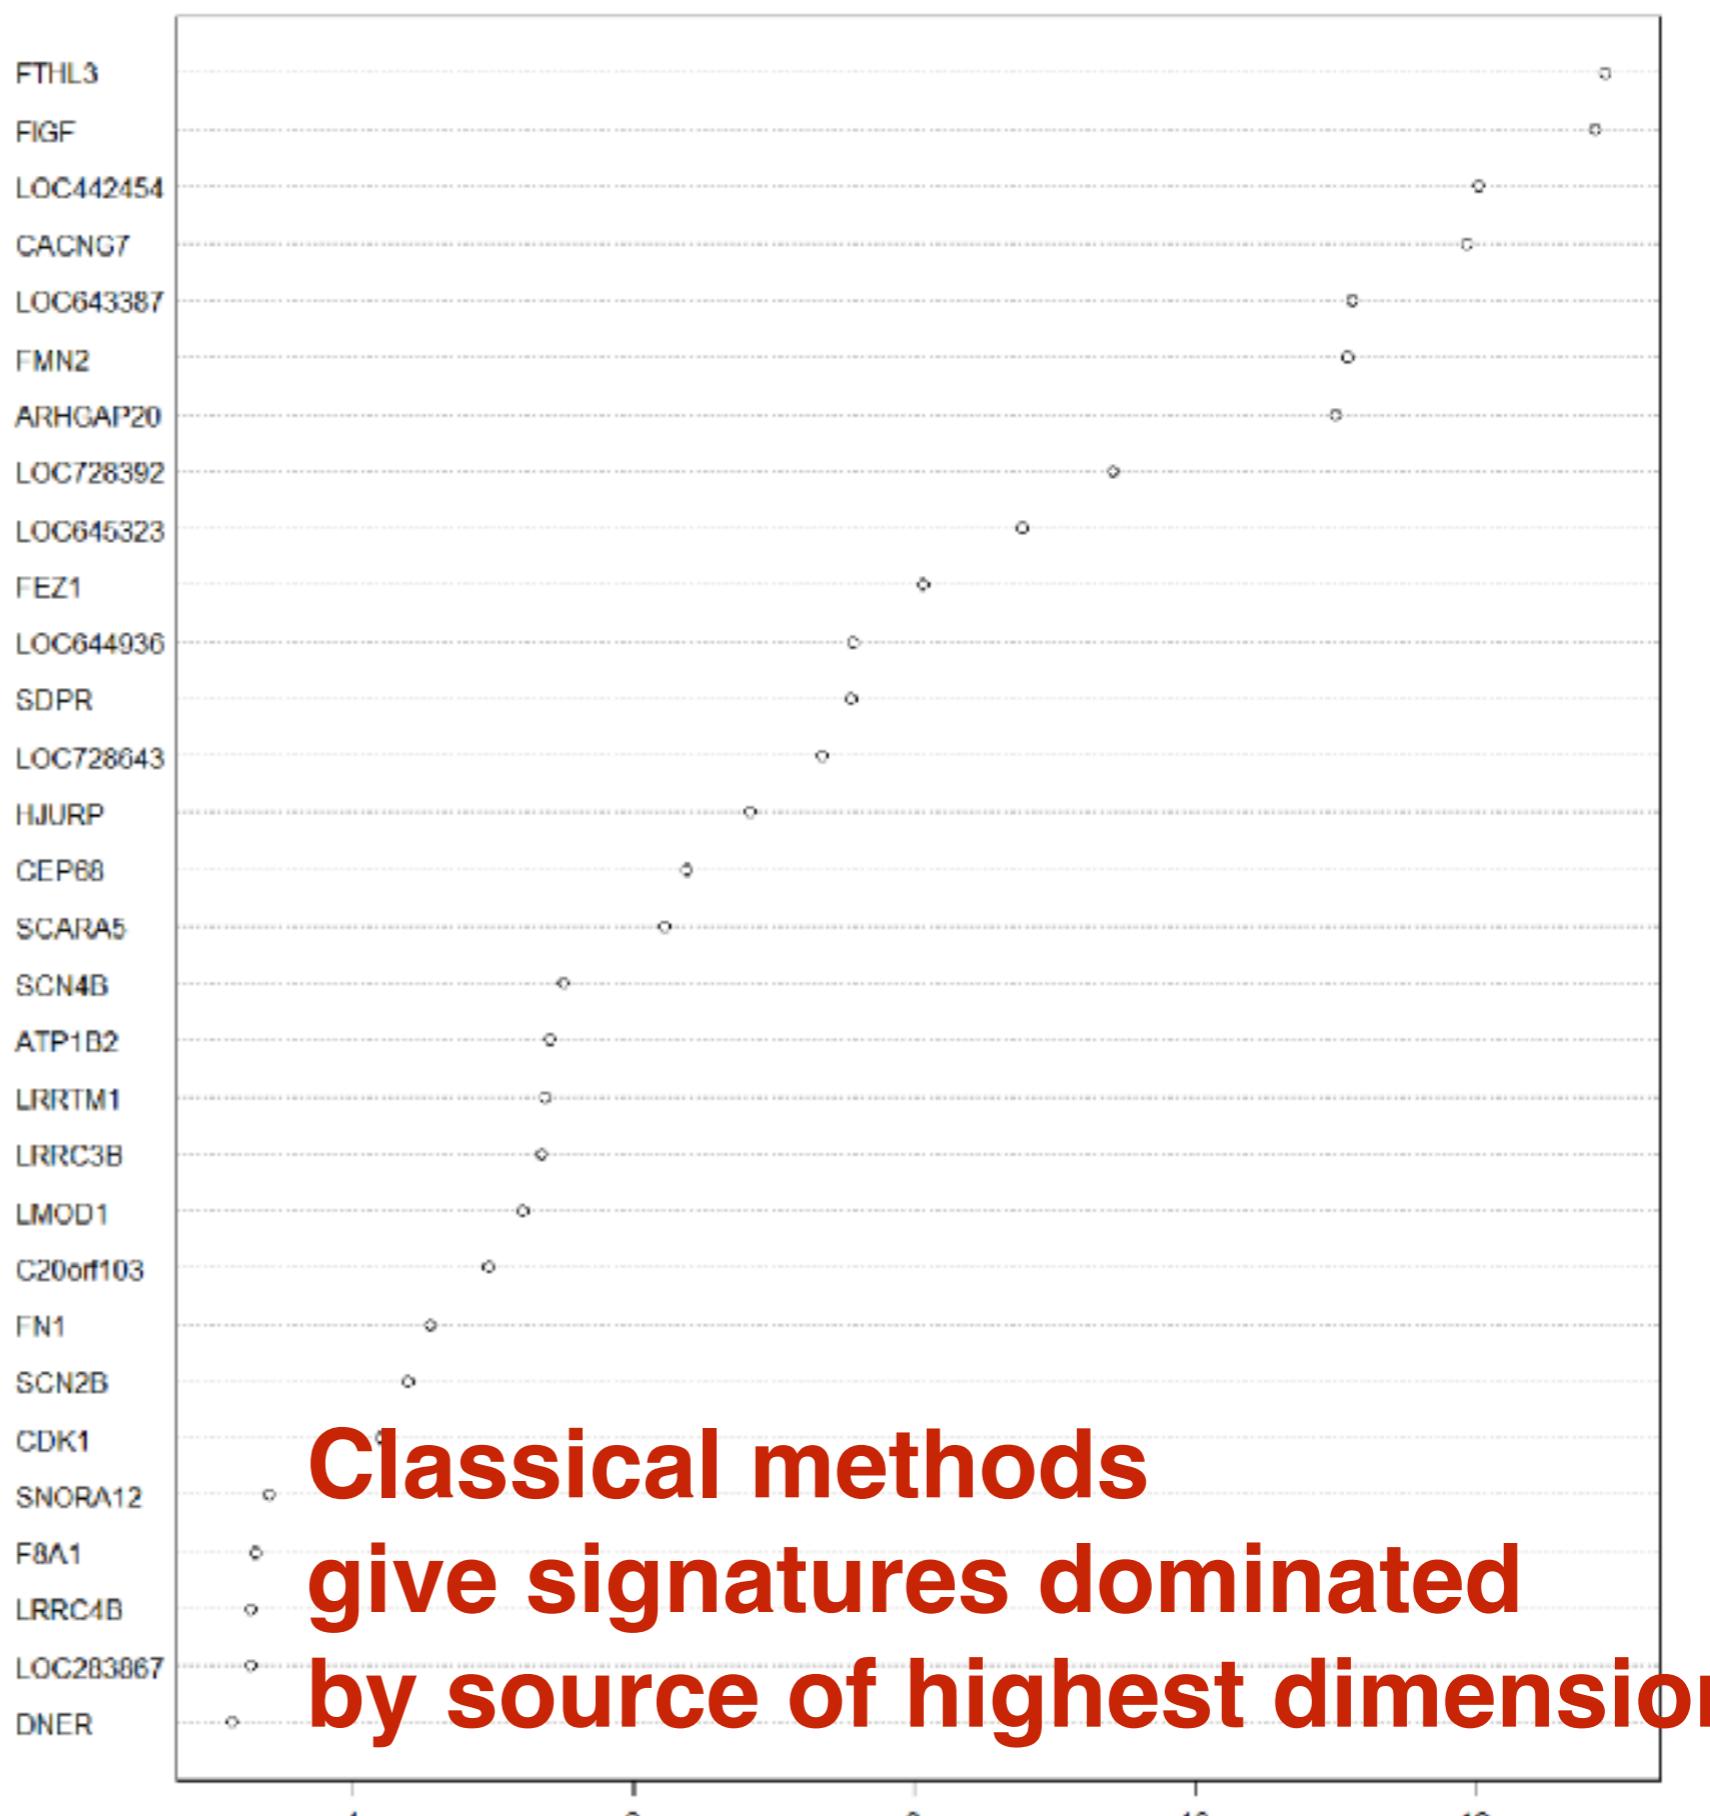

rozmiar: 1-100

Cechy mRNA

rozmiar: 100 - 20 000

Cechy metylacji

rozmiar: 10 000 - 1 000 000

Problem 4

Modified Bayesian Information Criteria

$$BIC = -2 \log L(M_i, \hat{\theta}_i) + k_i \log(n)$$

$$mBIC = -2 \log L(M_i, \hat{\theta}_i) + k_i^{cli} p_{cli} + k_i^{gen} p_{gen} + k_i^{met} p_{met}$$

Dopasowanie modelu

kara za cechy kliniczne

kara za cechy mRNA

kara za cechy methylacyjne

W podobny sposób możemy dodawać więcej źródeł danych

Problem 4

Modified Bayesian Information Criteria

$$mBIC = -2 \log L(M_i, \hat{\theta}_i) + k_i^{cli} p_{cli} + k_i^{gen} p_{gen} + k_i^{met} p_{met}$$

[GitHub project](#)

Workflow of RTCGA package

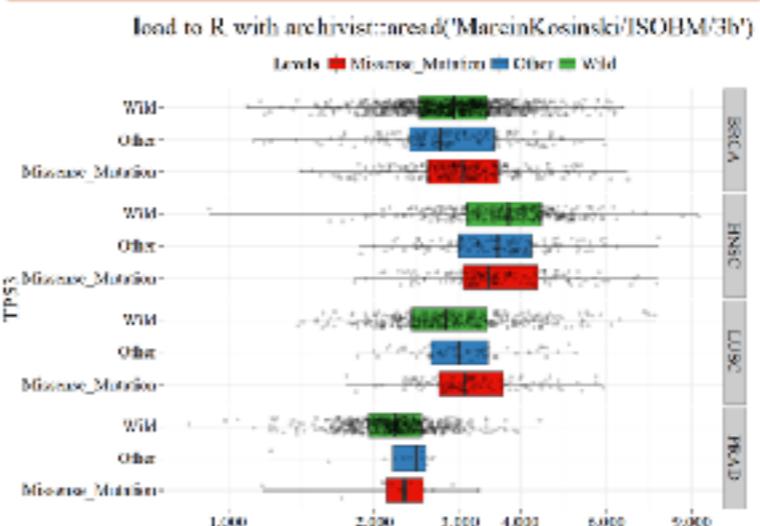

This can be reproduced in R with

```
library(RTCGA.rnaseq)
rnaseqBiplot(c("ACC", "CHOL", "GBM", "PCPG", "UVM"))
```

This can be reproduced in R with

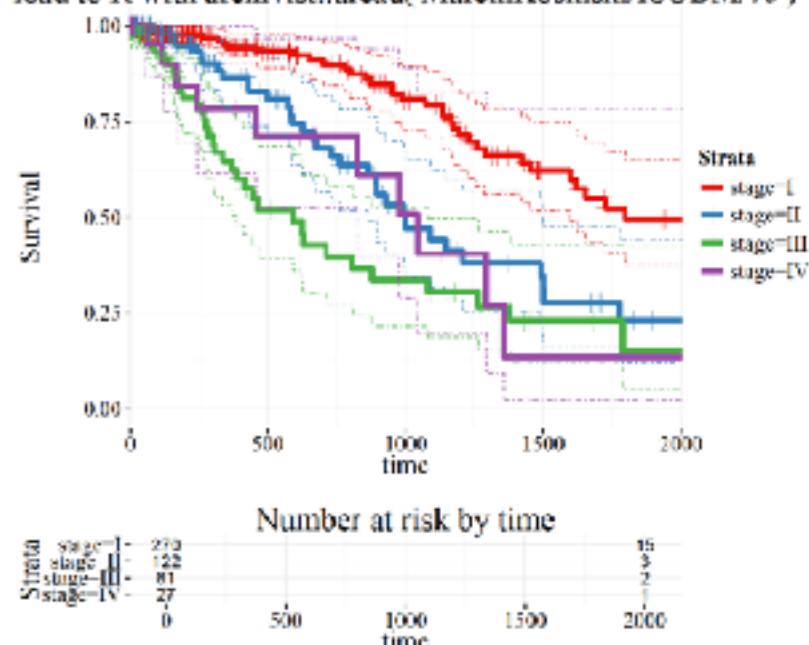

```
library(RTCGA.mutations);library(RTCGA.rnaseq)
mutationsBox(c('BRCA', 'HNSC', 'LUSC', 'PRAD'), 'TP53', 'ETFE1')
```

This can be reproduced in R with

```
library(RTCGA.clinical)
clinicalStageSurvival(LUAD.clinical, xlims = c(0,2000))
```

load to R with archivist::aread('MarcinKosiński/ISOBM/75')

Maintainer: Marcin Kosiński
